

UIUX ASSIGNMENT

1. Download and install Figma, then explore its interface, projects, and team spaces.

1. Team Spaces & Projects

The macro-organization layer where teams manage files and permissions.

- **Team Space:** The central shared company or department hub. It is where multi-layered user permissions are handled and where shared **UI Component Libraries** and design tokens live.
- **Projects:** Structural folders inside the team space used to organize files by specific platforms, release sprints, or product features.

2. The Core Canvas Interface

When working inside a design file, the infinite canvas workspace is divided into three distinct functional columns:

- **Left Sidebar (Layers & Pages):** Houses file organization. Use **Pages** to separate high-fidelity mockups from scratchpad wireframes. The **Layers Panel** maps out the precise, nested hierarchy of your vector groups and layout frames.
- **The Infinite Canvas (Center Viewport):** The central playground where designs sit side-by-side. Layout coordinates use independent **Frames (F)** to establish structural grid systems and responsive bounding rules rather than flat shapes.
- **Right Sidebar (Contextual Inspectors):** Dynamically updates based on your current workspace selection:
 - **Design Tab:** Manages alignment, constraints, absolute dimensions (\$X, Y, W, H\$), colors, strokes, and shadows.
 - **Prototype Tab:** Wires up interactive click-through user flows, assigning triggers (like *On Tap* or *While Hovering*) and transitions (like *Smart Animate*).
 - **Dev Mode / Inspect:** Translates visual layout groupings into frontend developer handoff tokens, outputting real padding spaces, font measurements, and raw CSS/iOS/Android styles.

2. Create a new Figma file and organize layers properly

> Use groups, frames, and alignment tools to structure elements neatly

> Practice positioning, resizing, and scaling elements effectively

Clean Architecture Techniques Used:

Encapsulated Coordinate Spaces

Isolated Component Boundaries

Relative Scaling

3. Experiment with basic Figma tools by creating simple shapes

> Use the rectangle, ellipse, polygon, line, and arrow tools to design a basic layout

> Explore the text tool, applying different fonts and formatting

Toolkit Tool Mapping Directory:

1. **Rectangle** : Formulates the structural outer bounding canvas and the solid white high-depth layout wrapper card components.
2. **Ellipse** : Crafts the clean circular header identity backdrops and sets up data points overlaid across trending chart nodes.
3. **Polygon** : Builds custom asymmetric vector structures—specifically the outer badge label housing the metrics, as well as the geometric upward-trending status icon triangle.
4. **Line** : Constructs layout horizontal delimiters, faint metric data grids, and high-fidelity mathematical X/Y tracking graph axes.
5. **Arrow** : Interlocks custom arrowhead geometry onto running line nodes to render automated, direction-aware layout trends seamlessly.

4. Use collaboration features to interact with a peer

> Add comments on elements to share feedback

>Share the Figma file with a classmate and explore real-time editing

> Publish a simple design to the Figma Community

1. Contextual Commenting (C)

Instead of sending long emails or messy chat screenshots, you can drop feedback directly onto specific pixels or UI elements.

Dropping a Pin ,Mentioning Teammates ,Threads and Resolutions

2. Real-Time Editing & Multiplayer Mode

Figma lets multiple users edit the exact same canvas simultaneously, acting like a Google Doc for vector design.

Inviting a Classmate , Observation Mode (Follow Along) , Live Co-authoring

3. Publishing to the Figma Community

The Figma Community is a massive, open-source ecosystem where creators share UI kits, wireframe templates, and plugins with millions of global designers.
